How to accelerate, cancel your MetaMask transactions

It can happen that MetaMask **transactions pile up** or **get slow**.

If you have a **pending transaction** no other transactions will go through until the pending one gets through.

You can **accelerate**, **cancel transactions** and even **reboot** your MetaMask to clear **pending** transactions.
- In most cases, the gas price you submitted was too **low**. In this case simply **accelerating** (increasing the gas for the transaction) will resolve the issue
- If you do not want to pay the increased gas fee you can **cancel** the transaction
- If the problem persists, follow the **rebooting** procedure

The follow links will guide you through some of these issues:

1- Basic background of blockchain and Ethereum

2- Introduction to MetaMask

3- How to Speed Up or Cancel a MetaMask Pending Transaction

4- Reset your MetaMask Account in case of excessive pending transactions:

5- Using MetaMask On Multiple Computers
